EuFund

Private-source funding workflow portfolio case study

Status & evidence boundary — What this case study does and does not claim

Status: EuFund is a private-source portfolio project in active development. No public deployment is claimed, and the repository is not presented as open source. This case study describes the portfolio implementation and design intent; it is not evidence of a production service, regulatory certification, customer usage or autonomous submission.

Role: Founder and sole engineer; domain input from prior EU-funded project delivery.

Author: Vasile Bogdan Godja · godjabogdan@gmail.com · github.com/Bogdan0708

01 Problem & workflow

Human control around funding work

Problem

Funding discovery and applications combine fragmented programme material, eligibility rules, narrative drafting and document review. The design focuses on making those steps explicit and reviewable.

Workflow design

- Discovery and retrieval over programme material.
- Deterministic eligibility checks with evidence attached to decisions.
- Draft generation from approved context, followed by human review.
- Cross-checking of draft, budget and source requirements; users remain responsible for submission.

02 Architecture

Implementation described conservatively

Primary stack

The reviewed private source is centred on Next.js and TypeScript, with PostgreSQL/Drizzle, Qdrant, Redis, structured validation and configurable LLM providers. Python tooling supports offline agent/evaluation work rather than defining the main web runtime.

Engineering choices

- Workflow state controls sequence; model calls supply bounded reasoning or drafting.
- Eligibility and factual outputs are designed to retain source citations.
- Provider routing and retrieval are implementation surfaces that still require environment-specific validation.

03 Outcome & next steps

What the project proves today

Portfolio evidence

The repository demonstrates domain modelling, workflow orchestration, retrieval, structured outputs and a security-conscious data design. These are implementation signals, not proof of live operation.

Next evidence gates

- Run and publish repeatable test/evaluation evidence without exposing private applicant data.
- Validate citations and eligibility against a dated corpus snapshot.
- Complete security review and deployment verification before making hosting claims.
