

EuFund

AI-assisted funding discovery, drafting and review

Project overview · Offline portfolio work · reviewed 14 September 2026

Problem

Funding work combines fragmented programme material, eligibility rules and document review. I translated that process into explicit stages so a user can inspect the evidence and control progress.

Engineering decision

Workflow state governs phase order and tool access. The model retrieves or drafts within those boundaries; a separate write gate controls write tools. Citation checks tie references to evidence shown to the model.

My contribution

Founder and sole engineer: workflow modelling, TypeScript implementation and tests, informed by prior EU-funded project delivery.

Visual evidence

Code-derived workflow map of the public exhibit; not an application screenshot. Main platform private and offline.

Engineering evidence

Dated verification, implementation scope and remaining work

Implementation

Next.js and TypeScript form the private application runtime, with PostgreSQL/Drizzle, Qdrant and configurable LLM providers. The public exhibit extracts the phase machine, tool controls, retrieval and routing; it does not contain the application UI or database layer.

Task tiers resolve provider/model choices. An ordered provider chain retries with isolated state when a provider fails. Structured-output validation allows one re-prompt on schema failure.

Evidence to inspect

Public exhibit: <https://github.com/Bogdan0708/eufund-exhibit> — 57 tests in the dated 13 September verification. Synthetic fixtures exercise phase transitions, tool/write gates, citation checks and provider failover.

The diagram on page 1 follows the public exhibit workflow. Retrieval fixtures use a deterministic embedder and injected provider interfaces; this is not real-provider evaluation evidence.

Status and limitations

EuFund is a private-source portfolio project in active development. Main source remains private; the extracted exhibit is public. No current hosted funding service, customer adoption, regulatory certification or autonomous submission is claimed.

Cloud Build/Cloud Run deployment configuration is a reference, not proof of current service health. Eligibility and factual outputs need validation against a dated corpus before external use.

Next validation

Review citations and eligibility on repeatable cases; validate environment-specific retrieval and provider integrations. Users remain responsible for reviewing and submitting funding applications.
